DUAL ACCELERATION FLOW CELL SYSTEM

Reduces the velocity gap between sheath flow and blood cells, providing a more stable signal for accurate measurement via laser scatter

LATEST INNOVATION TRI-ANGLE LASER SCATTERING

The tri-angle laser scattering contributes to more accurate counting. The optical detector receives scatter light signals and converts them into electrical pulses.

CHEMICAL DYE METHOD BY ORIGINAL REAGENTS

The basophils and eosinophils are differentiated by the unique chemical dye method. The reagents, control and calibrator materials act as one complete system to ensure high accuracy in differentiating between basophils and eosinophils

TWO SEPERATE CHANNELS TO DIFFERENTIATE WBC

Counts lymphocyte, monocyte, neutrophil and eosinophil in Diff channel, and basophil in a separate Baso channel. Optical method to test Basophil provides more reliable information about cell physiology.
